

Quick Start Procera® Prep Guide

Anterior

For best results with Procera® restoration, the prep design should allow access for *the scanning probe*. (see image on the left)

Use a conventional all-ceramic preparation design consisting of a chamfer or a rounded shoulder type design.

Place three orientation depth grooves using Brasseler bur 6878K-021. ③

Connect the orientation grooves together. ③

Reduce of the incisal surface approximately 2mm. Use the tip of the 6878K-021 burr as a guide. ③

A two plane preparation allows for correct and sufficient tooth reduction. ③

Reduce cingulum area, reassuring the same quality of preparation established on the facial surface. ③

Break the mesial and distal contact area. Avoid infringing on the biologic width. ② ③

Reduce incisal and central third of the tooth reassuring an ideal lingual clearance. Round off all sharp corners. ④

Refine and smooth the chamfer upward a distance of 0.5mm into the sulcus. ③ ②

- Avoid "J" shaped preparation margin
- Avoid sharp-ended or butt margin
- Avoid one-plane facial tooth reduction
② ③ ④
